```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present sequence represents a human beta-transducin repeat containing C protein (beta-TrcP). The protein directs proteins to the proteosome CC degradation pathways. The protein is able to interact with the Vpu CC protein of human immune deficiency virus-1 (HIV-1), cellular proteins CC likappaB or beta-catenin (bC) and/or protein Skplp. The protein controls CC ubiquitinylation of phosphorylated proteins and thus their targeting to CC proteosomes for degradation. Depending on whether the process is CC inhibited or promoted, the result may be delayed breakdown of CD4 (in CC cases of HIV-1 infection); increased activity of IkB (and thus reduced CC activity of NFkappaB) and increased activity of mutant bC in tumour CC cells, or increased bC survival (and reduced apoptosis) in Alzheimer's CC nucleic acid, are used to screen for anti HIV-1 agents (antivirals), CC antitumour agents that disrupt cell cycle regulation or protein CC disrupt activation by NFkappaB. Fragments of the protein are also CC useful for treating osteo-articular inflammation or acute inflammation
                                                                                                                                                                                                                                                                                                                                                                          Matches 569;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 2
                        The present invention describes an F-box motif protein of ubiquitin ligase SCF complex which promotes the ubiquitination of IkappaB or beta-catenin and is constituted by Skpl protein, Cull protein and a complex (SCF complex) of F-box protein containing F-box motif and WD40 repeat motif and has the amino acid sequence of 45 residues (AAB12811) or one of two 569 residue sequences (AAB12812, which is mouse ubiquitin ligase FWD1 protein) and (AAB12B13, which is human beta-transducin repeat containing protein (beta-TrCP)). The F-box protein can be used for the gene therapy of colon cancer by being recombined to a virus vector.

```

Claim 21; Page 72-74; 77pp; English.

Human beta-TrCP, an F-box/WD protein family member, has been shown to Chave homology to human E3 ubiquitin ligase (E3). E3 enhances ubiquitination of phosphorylated I-kappa-B, an inhibitor protein of C2 ubiquitination of phosphorylated I-kappa-B. In inhibitor protein of nuclear factor kappa-B (NF-kappa-B). Understanding I-kappa-B C2 degradation via the ubiquitin pathway is useful for identifying C3 modulators of this process for use in treating diseases associated with C4 activation of NF-kappa-B. In vitro analysis suggests that deletion of C4 the F-box results in a protein that functions as a dominant negative molecule in vivo. Translent over-expression of delta-beta-TrCP (a deletion mutant) inhibited the degradation of endogenous I-kappa-B-alpha C3 can be used to screen for modulators of NF-kappa-B CC in stimulated Jurkat cells, resulting in accumulation of phosphorylated C1 -kappa-B-alpha B can be used to screen for modulators of NF-kappa-B CC inflammatory diseases, autoimmune diseases, cancer and viral infections. Sequence 569 AA;

Cells expressing such proteins or their fragments are useful for screening compounds. The compounds are agonists or antagonists, which are useful for treating a proliferative or differentiative disorder in a mammal such as breast, ovarian and prostate cancer and small cell lung carcinoma and also major opportunistic infections, immune disorders, cardiovascular diseases and inflammatory disorders. FBP protein, analogs, derivatives and their subsequences, anti-FBP antibodies are also useful in diagnosis of the disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid for screening compounds useful for treating proliferative and differentiative disorders such as cancer and disorders comprises sequences encoding ubiquitin limages.

```

The F-box proteins are a family of ubiquitin ligases (SCF ubiquitin ligases) which can be used for the targetted degradation of a target polypeptide in vivo. Targetted degradation is achieved by expressing the ubiquitin ligase in a cell linked to the interaction domain of the target polypeptide and thereby recruiting the target polypeptide to the ubiquitin ligase. Such methods are useful for decreasing or increasing the level of a target polypeptide and for creating and expressing a destabilized polypeptide which is subjected to SCF mediated proteolysis. Degrading any desired protein in a cell is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   useful for preventing or treating diseases caused by the presence of abnormal amount of the specific polypeptides, for drug discovery and for gene therapy. Diseases treated include caner, by degradation of oncoproteins, Huntington's disease, other proliferative disorders and microbial infections. The method provides a quick and easy alternative to gene knockout technology. The target polypeptide can be degraded at all stages, or a specific stage, of development in the

Fragments of CSIGP encoding nucleic acid can be used as hybridisation probe for detecting CSIGP related sequences or allelic variants. Recombinant CSIGP can be produced in host cells by transforming them with genetically engineered vectors. Agonists or antagonists can be used in the treatment of cell proliferative and inflammatory disorders associated with decreased or increased CSIGP expression. CSIGP is used in the diagnosis, prevention and treatment of cell proliferative disorders like arteriosclerosis, cirrhosis, cancer, hepatitis and inflammatory
